Abstract

This is the 50 ODEs of the Kamke test suite as published by E. S. Cheb-Terrab[1]. They have been rewritten using Axiom syntax. Where possible we show that the particular solution actually satisfies the original ordinary differential equation.

Maxima, if $4ab + 1 \geq 0$ gets:

$$x = \%c\%e \frac{\log \left(-\frac{-2axy + \sqrt{4ab + 1} + 1}{2axy + \sqrt{4ab + 1} - 1} \right)}{\sqrt{4ab + 1}}$$

and if $4ab + 1 < 0$ gets:

$$x = \%c\%e \frac{2 \arctan \left(\frac{2axy - 1}{\sqrt{-4ab - 1}} \right)}{\sqrt{-4ab - 1}}$$

neither of which simplify to 0 on substitution.
